Sunray™

Heated Flooring System

what is the **Sunray™** *Heated Flooring System?*

The Sunray is an electric floor heating system for tile, stone, laminates and other engineered wood floors*. The heat from the coils radiates through and warms you with every step you take. It is just what you need to keep you warm and comfortable in those cold winter months.

How does it work?

Floor sensors are installed beneath the tiles in order to monitor the temperature of the floor.

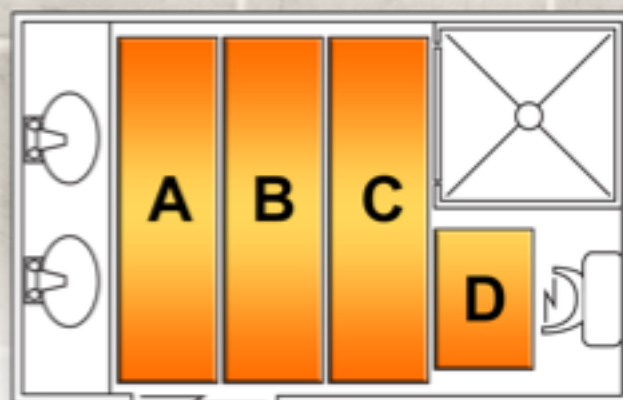

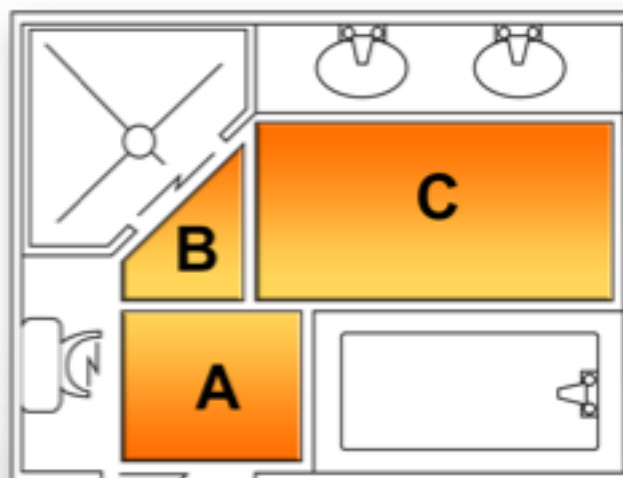

Programming options are available on the thermostat as well as an on/off switch for when you'll be out of your home. The average

installation takes about 2-4 hours.

Depending on the finish on the floor and the availability of the electrical panel, the final installation may take only a couple of days. The Sunray heating system only uses enough electricity to heat your floor to the desired temperature. The unit will turn off when the floor reaches said temperature.

*For use under engineered wood floors only. Not approved for nail down installations.

It is simple to choose the kit that will most closely fit your square footage.

CAUTION: Any combination that exceeds 10 amps should be installed by a qualified technician. Installation in a bathroom requires the device be installed on a circuit protected by a separate Ground Fault Circuit Interrupter.
